

E-commerce Sales Data Analysis Using MS Excel

Dataset Description

The dataset consists of **four sheets**, each representing a different business entity. These sheets are interconnected using unique IDs.

Sheet 1: Customer Data

Contains demographic and loyalty information of customers.

Sheet 2: Product Data

Contains product-related details including category, cost, and stock levels.

Sheet 3: Store Data

Contains store information such as region, city, and store type.

Sheet 4: Sales Data

Contains transaction-level sales details including quantity sold, discounts, payment type, and total amount.

Column Description

Formula used for	Formula details
Trim and Clean	=trim(clean(b2:b8))
vlookup	=VLOOKUP(Customer_ID, Customer_Data!A:H, 8, FALSE)

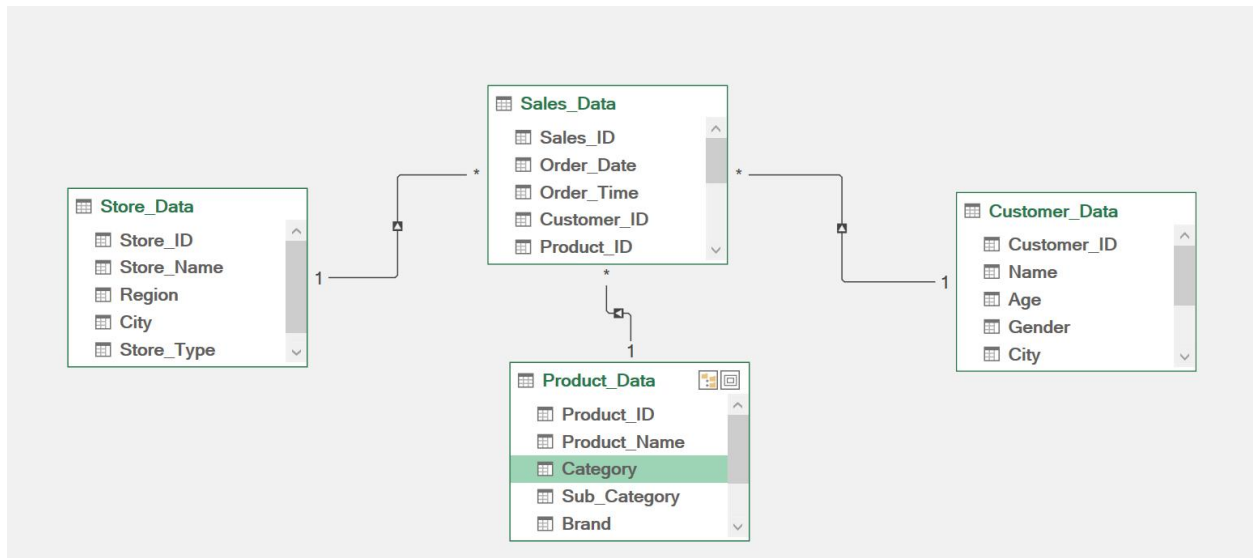

Customer Data → who is buying, **Product Data** → what is being sold

Store Data → from where it is sold, **Sales Data** → actual transactions

- Sales Data is the **main table**
- Other 3 sheets are **master tables**
